

To whom it may concern

Following the filing of IP for a new electronic system application some 2 years ago I had a need for a sub-contractor to design and develop the system. I prepared a detailed and clear specification and tried to identify a local business capable of carrying out the work. Finding a skills match for the project in Northern Ireland was not as easy as I had hoped.

Eventually I found a business claiming to have the necessary skills. The job should have taken no longer than 9 months. Some 2 years later, having bent over backwards to offer support and being forced to compromise the original performance requirements, the outcome was simply not viable.

Fortunately for me I remembered working with Select Software some 8 years previously and realised that they may just be able to pull me from the brink of what had become a career threatening disaster. I renewed my contact with David Aarons at Select Software and explained what I was trying to do and asked if he could help me out of the difficult position I was clearly in.

I forwarded my original specification documents and met with David and Les within two weeks to discuss the application in detail. Within 3 months of picking up the project I was able to have my second meeting at Select and see the first prototype board operating.

The full prototype system was delivered just 4 months later.

I give Select Software my strongest recommendation. The technical knowledge and expertise is second to none, for both hardware design and embedded software control. Throughout the project there has been an unparalleled willingness to continually review the needs and performance criteria with a desire to offer improvement and optimisation.

I am totally satisfied and impressed with both the standard of service and the developed product.
